Adam Furbee

Senior Software Engineer with 10+ years of experience building internal developer platforms, cloud-native infrastructure, and software. I enjoy getting deeply technical across a broad range of engineering disciplines and am always looking to learn more or go one layer of abstraction deeper

EXPERIENCE

Sony Interactive Entertainment — *Senior Software Engineer, Platform*

Dec 2024 - Present

- Designed and built a CD control plane in Go and Kubebuilder that reduces the problem of building a CD promotion strategy to defining where your application artifacts live and what clusters you want to deploy to. The controller handles ensuring predetermined policies are enforced, RBAC is created, and creates the required resource in ArgoCD and Kargo.
- Designed and built reusable Dagger modules in Go for CI (build, test, lint, code quality scans) and CD (security scans) that can be used across Jenkins, GitLab, and GitHub.
- Partner closely with other teams such our Kubernetes provisioning team and Networking teams to build solutions so that when a new cluster gets created it is registered in our CD system as a valid target and network access is provisioned.
- Perform troubleshooting for various systems across a broad range of domains such as Okta IAM, bare metal host provisioning via PXE, internal and external DNS, AWX, Cilium double SNAT issues with docker-in-docker, containerd configuration issues, and AWS routing to on-prem nodes over a private connection to name a few

JPMorgan Chase — *Senior Lead Software Engineer*

July 2024 - Dec 2024

- Developed terraform providers in go and ansible modules in python
- Architected observability practices for our internal apps using Grafana, Splunk, and Prometheus

Crunchbase — *Senior Infrastructure Engineer*

March 2023 - June 2024

- Developed an internal Admission Controller in Go for Kubernetes that checks image scans for known vulnerabilities
- Rewrote CI/CD logic for one of our critical ETL applications so that if major batch operations were not needed we could reduce the time needed to deploy this app from weeks to minutes in the common case
- Migrated our Kafka infrastructure from a costly x86_64 SKU to a cheaper Graviton instance with EBS improving throughput performance by 40% without increasing cost. Lots of benchmarking was performed with [fio](#) and then a gradual migration was performed since this was a mission critical application
- Wrote Lua for our internal microservice routing and authentication logic using OpenResty on NGINX. This was essentially a minimalistic implementation of nginx-ingress

Microsoft — *DevOps Engineer*

Dec 2021 - Jan 2023

- Architected HA multi-region AKS clusters
- Performed migration of a mission-critical production service from AWS to Azure with 0 downtime and thousands of concurrent users.
- Developed CI/CD pipelines for teams using Helm and Azure DevOps

Shell — DevOps Engineer

Dec 2020 - Dec 2021 FTE

Jan 2020 - Dec 2020 Contract through Precision Global Consulting

- Built a platform so internal teams at shell could request a short lived sandbox account in azure for their internal testing that had a required expiration date and standard policies applied to it that would mimic a real environment
- Maintained AKS clusters for various teams
- Developed internal Azure terraform modules for use across Shell as the standard interface for creating resources.

Sam Houston State University — Software Technician, Linux System Administrator

Sept 2015 - Jan 2020

- Automated Linux OS patching through Ansible, AWX, and RH Satellite and custom python tooling to query systems from our CMDB for patching and change request scheduling
- Built and managed Splunk infrastructure for all linux and windows systems
- Built and managed our Shibboleth systems for University SAML SSO and handled new SSO integrations as needed
- Built and managed the university HPC Slurm cluster using OpenHPC and custom packages and libraries. I also dove into RDMA and ensured the cluster was capable of using RoCEv2 for low latency memory io.
- Released an open source project [git2jss](#) that gathered a small following in the macOS admin community

Additional Information

Technologies Used

Go • Python • Lua • Bash • C • Kubernetes • GitHub Actions • Dagger • Backstage • ArgoCD • Kargo • Helm • GitOps • Internal Developer Platforms • AWS • Azure • Docker • Terraform • Ansible • VMware • OpenTelemetry • Prometheus • Grafana • Loki • Splunk • Datadog • New Relic • DevLake • Platform Architecture • Kubernetes Operators • REST APIs • CI/CD • Infrastructure as Code • Developer Experience (DevEx)

Open Source Contributions

Although recently most of my code contributions have to private or internal version control systems I have a few open source projects I maintain on my [public github](#) as well as make contributions to upstream open source projects, giving back to projects I or an organization I am employed by benefits from is something that is very important to me.

Personal Website

I maintain a personal blog at <https://badstreff.com/> where I will occasionally write about topics I find interesting or a cool personal project
